## Executive Summary

To predict student achievement on the Kentucky Performance Rating for Educational Progress (K-PREP) assessments in Grades 3–8 Reading and Mathematics, NWEA® conducted a linking study using Spring 2014 data to derive Rasch Unit (RIT) cut scores on the MAP® Growth™ assessments that correspond to the K-PREP performance levels. With this information, educators can identify students at risk of failing to meet state proficiency standards early in the year and provide tailored educational interventions. The linking study has been updated since the previous version published in February 2016 to incorporate the new 2020 NWEA MAP Growth norms (Thum & Kuhfeld, 2020).

Table E.1 presents the K-PREP *Proficient* performance level cut scores and the corresponding MAP Growth RIT cut scores that allow teachers to identify students who are on track for proficiency on the state summative test and those who are not. For example, the *Proficient* cut score on the K-PREP Grade 3 Reading test is 210. A Grade 3 student with a MAP Growth Reading RIT score of 191 in the fall is likely to meet proficiency on the K-PREP Reading test in the spring, whereas a Grade 3 student with a MAP Growth Reading RIT score lower than 191 in the fall is in jeopardy of not meeting proficiency.

**Table E.1. MAP Growth Cut Scores for K-PREP Proficiency**

Assessment		Proficient Cut Scores by Grade					
		3	4	5	6	7	8
<b>Reading</b>							
K-PREP	Spring	210	210	210	210	210	210
MAP Growth	Fall	191	201	208	212	216	221
	Winter	198	207	212	216	219	223
	Spring	201	209	214	217	220	224
<b>Mathematics</b>							
K-PREP	Spring	210	210	210	210	210	210
MAP Growth	Fall	193	203	212	217	224	231
	Winter	200	210	218	222	228	234
	Spring	205	214	222	225	231	236

Please note that the results in this report may differ from those found in the NWEA reporting system for individual districts. The typical growth scores from fall to spring or winter to spring used in this report are based on the default instructional weeks most commonly encountered for each term (i.e., Weeks 4, 20, and 32 for fall, winter, and spring, respectively). However, instructional weeks often vary by district, so the cut scores in this report may differ slightly from the MAP Growth score reports that reflect spring instructional weeks set by partners.

### E.1. Assessment Overview

The K-PREP Grades 3–8 Reading and Mathematics summative tests are aligned to the Kentucky Academic Standards (KAS). Based on their test scores, students are placed into one of four performance levels: *Novice*, *Apprentice*, *Proficient*, and *Distinguished*. These tests are used to provide evidence of student achievement in Reading and Mathematics as part of the state’s accountability program. The *Proficient* cut score demarks the minimum level of achievement considered to be proficient. MAP Growth tests are adaptive interim assessments aligned to state-specific content standards and administered in the fall, winter, and spring. Scores are reported on the RIT vertical scale with a range of 100–350.

## E.2. Linking Methods

Based on scores from the Spring 2014 test administration, the equipercentile linking method was used to identify the spring MAP Growth scores that correspond to the spring K-PREP performance level cut scores. MAP Growth fall and winter cut scores that predict proficiency on the spring K-PREP test were then projected using the 2020 NWEA growth norms that provide expected score gains across test administrations.

## E.3. Student Sample

Only students who took both the MAP Growth and K-PREP assessments in Spring 2014 were included in the study sample. Table E.2 presents the number of Kentucky students from 27 districts who were included in the linking study.

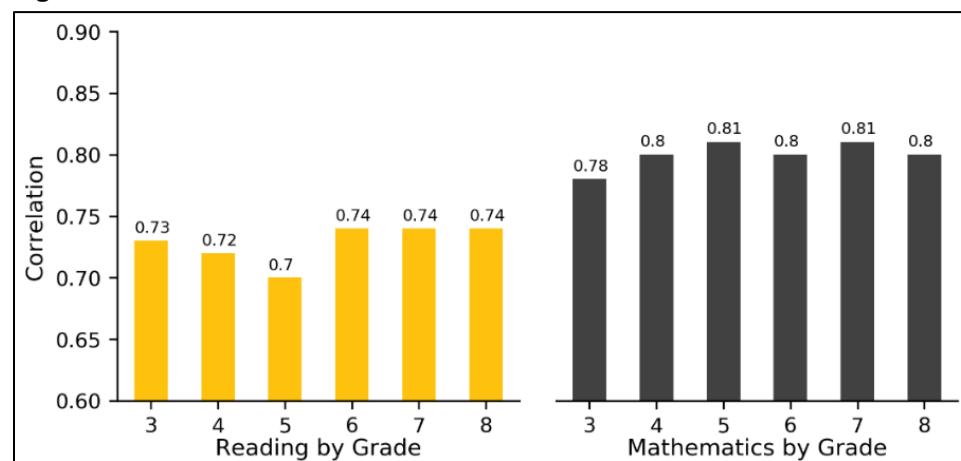

**Table E.2. Linking Study Sample**

Grade	#Students	
	Reading	Mathematics
3	9,619	9,635
4	10,165	10,164
5	10,013	10,011
6	10,440	10,449
7	10,283	10,312
8	10,038	10,004

## E.4. Test Score Relationships

Correlations between MAP Growth scores and K-PREP scores range from 0.70 to 0.81 across both content areas, as shown in Figure E.1. These values indicate a strong relationship among the scores, which is important validity evidence for the claim that MAP Growth scores are good predictors of performance on the K-PREP assessments.

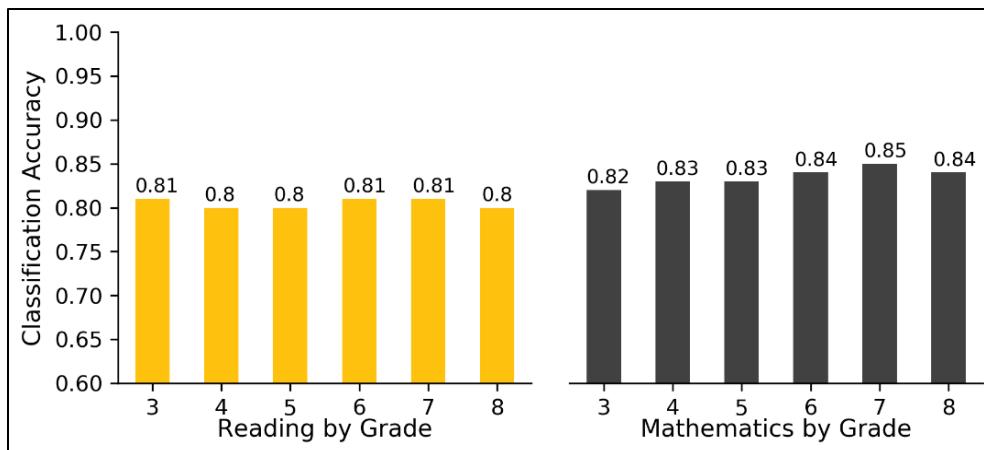

**Figure E.1. Correlations between MAP Growth and K-PREP Tests**

### E.5. Accuracy of MAP Growth Classifications

Figure E.2 presents the classification accuracy statistics that show the proportion of students correctly classified by their RIT scores as proficient or not proficient on the K-PREP tests. For example, the MAP Growth Reading Grade 3 *Proficient* cut score has a 0.81 accuracy rate, meaning it accurately classified student achievement on the state test for 81% of the sample. The results range from 0.80 to 0.85 across both content areas, indicating that RIT scores have a high accuracy rate of identifying student proficiency on the K-PREP tests.

**Figure E.2. Accuracy of MAP Growth Classifications**

## 1. Introduction

### 1.1. Purpose of the Study

NWEA® is committed to providing partners with useful tools to help make inferences about student learning from MAP® Growth™ test scores. One important use of MAP Growth results is to predict a student's performance on the state summative assessment at different times throughout the year. This allows educators and parents to determine if a student is on track in their learning to meet state standards by the end of the year or, given a student's learning profile, is on track to obtain rigorous, realistic growth in their content knowledge and skills.

This document presents results from a linking study conducted by NWEA in July 2020 to statistically connect the scores of the Kentucky Performance Rating of Educational Progress (K-PREP) assessments in Grades 3–8 Reading and Mathematics with Rasch Unit (RIT) scores from the MAP Growth assessments taken during the Spring 2014 term. The linking study has been updated since the previous version published in February 2016 to incorporate the new 2020 NWEA MAP Growth norms (Thum & Kuhfeld, 2020). This report presents the following results:

1. Student sample demographics
2. Descriptive statistics of test scores
3. MAP Growth RIT cut scores that correspond to the K-PREP performance levels using the equipercentile linking procedure for the spring results and the 2020 norms for the fall and winter results
4. Classification accuracy statistics to determine the degree to which MAP Growth accurately predicts student proficiency status on the K-PREP tests
5. The probability of achieving grade-level proficiency on the K-PREP assessment based on MAP Growth RIT scores from fall, winter, and spring using the 2020 norms

### 1.2. Assessment Overview

The K-PREP Grades 3–8 Reading and Mathematics summative assessments are aligned to the Kentucky Academic Standards (KAS). Each assessment has three cut scores (i.e., the minimum score a student must get on a test to be placed in a certain performance level) that distinguish between the following performance levels: *Novice*, *Apprentice*, *Proficient*, and *Distinguished*. The *Proficient* cut score marks the minimum level of performance considered to be proficient for accountability purposes.

MAP Growth interim assessments from NWEA are computer adaptive and aligned to state specific content standards. Scores are reported on the RIT vertical scale with a range of 100–350. Each content area has its own scale. To aid the interpretation of scores, NWEA periodically conducts norming studies of student and school performance on MAP Growth. Achievement status norms show how well a student performed on the MAP Growth test compared to students in the norming group by associating the student's performance on the MAP Growth test, expressed as a RIT Score, with a percentile ranking. Growth norms provide expected score gains across test administrations (e.g., the relative evaluation of a student's growth from fall to spring). The most recent norms study was conducted in 2020 (Thum & Kuhfeld, 2020).

## 2. Methods

### 2.1. Data Collection

This linking study is based on data from the Spring 2014 administrations of the MAP Growth and K-PREP assessments. NWEA recruited Kentucky districts to participate in the study by sharing their student and score data for the target term. Districts also gave NWEA permission to access students' associated MAP Growth scores from the NWEA in-house database. Once Kentucky state score information was received by NWEA, each student's state testing record was matched to their MAP Growth score by using the student's first and last names, date of birth, student ID, and other available identifying information. Only students who took both the MAP Growth and K-PREP assessments in Spring 2014 were included in the study sample.

### 2.2. MAP Growth Cut Scores

The equipercentile procedure (Kolen & Brennan, 2004) was used to identify the spring MAP Growth RIT scores that correspond to the spring K-PREP performance level cut scores. MAP Growth fall and winter cut scores that predict proficiency on the spring K-PREP test were then projected using the 2020 growth norms. Percentile ranks are also provided that show how a nationally representative sample of students in the same grade scored on MAP Growth for each administration, which is an important interpretation of RIT scores. This is useful information for understanding (1) how student scores compare to peers nationwide and (2) the relative rigor of a state's performance level designations for its summative assessment.

The MAP Growth spring cut scores could be calculated using the equipercentile linking method because that data are directly connected to the K-PREP spring data used in the study. The equipercentile linking procedure matches scores on the two scales that have the same percentile rank (i.e., the proportion of tests at or below each score). For example, let  $x$  represent a score on Test  $X$  (e.g., K-PREP). Its equipercentile equivalent score on Test  $Y$  (e.g., MAP Growth),  $e_y(x)$ , can be obtained through a cumulative-distribution-based linking function defined in Equation 1:

$$e_y(x) = G^{-1}[P(x)] \quad (1)$$

where  $e_y(x)$  is the equipercentile equivalent of score  $x$  on K-PREP on the scale of MAP Growth,  $P(x)$  is the percentile rank of a given score on K-PREP, and  $G^{-1}$  is the inverse of the percentile rank function for MAP Growth that indicates the score on MAP Growth corresponding to a given percentile. Polynomial loglinear pre-smoothing was applied to reduce irregularities of the score distributions and equipercentile linking curve.

The MAP Growth conditional growth norms provide students' expected score gains across terms, such as growth from fall or winter to spring within the same grade or from spring of a lower grade to the spring of the adjacent higher grade. This information can be used to calculate the fall and winter cut scores. Equation 2 was used to determine the previous term's MAP Growth score needed to reach the spring cut score, considering the expected growth associated with the previous RIT score:

$$RIT_{predSpring} = RIT_{previous} + g \quad (2)$$

where:

- $RIT_{PredSpring}$  is the predicted MAP Growth spring score.
- $RIT_{previous}$  is the previous term's RIT score.
- $g$  is the expected growth from the previous RIT (e.g., fall or winter) to the spring RIT.

### 2.3. Classification Accuracy

The degree to which MAP Growth predicts student proficiency status on the K-PREP tests can be described using classification accuracy statistics based on the MAP Growth spring RIT cut scores that show the proportion of students correctly classified by their RIT scores as proficient (*Proficient* or *Distinguished*) or not proficient (*Novice* or *Apprentice*). Table 2.1 describes the classification accuracy statistics provided in this report (Pommerich, Hanson, Harris, & Sconing, 2004). The results are based on the Spring 2014 MAP Growth and K-PREP data for the *Proficient* cut score.

**Table 2.1. Descriptions of Classification Accuracy Summary Statistics**

Statistic	Description*	Interpretation
Overall Classification Accuracy Rate	$(TP + TN) / (\text{total sample size})$	Proportion of the study sample whose proficiency classification on the state test was correctly predicted by MAP Growth cut scores
False Negative (FN) Rate	$FN / (FN + TP)$	Proportion of not-proficient students identified by MAP Growth in those observed as proficient on the state test
False Positive (FP) Rate	$FP / (FP + TN)$	Proportion of proficient students identified by MAP Growth in those observed as not proficient on the state test
Sensitivity	$TP / (TP + FN)$	Proportion of proficient students identified by MAP Growth in those observed as such on the state test
Specificity	$TN / (TN + FP)$	Proportion of not-proficient students identified by MAP Growth in those observed as such on the state test
Area Under the Curve (AUC)	Area under the receiver operating characteristics (ROC) curve	How well MAP Growth cut scores separate the study sample into proficiency categories that match those from the state test cut scores. An AUC at or above 0.80 is considered "good" accuracy.

\*FP = false positives. FN = false negatives. TP = true positives. TN = true negatives.

### 2.4. Proficiency Projection

In addition to calculating the MAP Growth fall and winter cut scores, the MAP Growth conditional growth norms data were also used to calculate the probability of reaching proficiency on the K-PREP test based on a student's RIT scores from fall, winter, and spring. Equation 3 was used to calculate the probability of a student achieving *Proficient* on the K-PREP test based on their fall or winter RIT score:

$$Pr(\text{Achieving Proficient in spring} | \text{starting RIT}) = \Phi\left(\frac{RIT_{previous} + g - RIT_{SpringCut}}{SD}\right) \quad (3)$$

where:

- $\Phi$  is a standardized normal cumulative distribution.
- $RIT_{previous}$  is the student's RIT score in fall or winter.
- $g$  is the expected growth from the previous RIT (e.g., fall or winter) to the spring RIT.
- $RIT_{SpringCut}$  is the MAP Growth *Proficient* cut score for spring.
- $SD$  is the conditional standard deviation of the expected growth,  $g$ .

Equation 4 was used to estimate the probability of a student achieving *Proficient* on the K-PREP test based on their spring score ( $RIT_{Spring}$ ):

$$Pr(\text{Achieving Proficient in spring} \mid \text{spring RIT}) = \Phi\left(\frac{RIT_{Spring} - RIT_{SpringCut}}{SE}\right) \quad (4)$$

where  $SE$  is the standard error of measurement for MAP Growth.

### 3. Results

#### 3.1. Study Sample

Only students who took both the MAP Growth and K-PREP assessments in Spring 2014 were included in the study sample. Data used in this study were collected from 27 districts in Kentucky.

#### 3.2. Descriptive Statistics

Table 3.1 presents descriptive statistics of the MAP Growth and K-PREP test scores from Spring 2014, including the correlation coefficient ( $r$ ) between them. The correlation coefficients between the scores range from 0.70 to 0.74 for Reading and 0.78 to 0.81 for Mathematics. These values indicate a strong relationship among the scores, which is important validity evidence for the claim that MAP Growth scores are good predictors of performance on the K-PREP assessments.

**Table 3.1. Descriptive Statistics of Test Scores**

Grade	N	$r$	K-PREP*				MAP Growth*			
			Mean	SD	Min.	Max.	Mean	SD	Min.	Max.
<b>Reading</b>										
3	9,619	0.73	211.3	18.7	100	287	200.2	14.5	140	250
4	10,165	0.72	210.7	16.7	100	297	207.7	13.9	140	247

7	10,312	0.81	208.4	17.6	100	300	227.8	15.4	151	279
8	10,004	0.80	209.0	16.3	100	300	233.1	15.7	143	296

\*SD = standard deviation. Min. = minimum. Max. = maximum.

#### 3.3. MAP Growth Cut Score Predictions

Table 3.2 and Table 3.3 present the K-PREP scale score ranges and the corresponding MAP Growth RIT cut scores and percentile ranges by content area and grade. These tables can be used to predict a student's likely performance level on the K-PREP spring assessment when MAP Growth is taken in the fall, winter, or spring. For example, a Grade 3 student who obtained a MAP Growth Reading RIT score of 191 in the fall is likely to reach *Proficient* on the K-PREP Reading test. A Grade 3 student who obtained a MAP Growth Reading RIT score of 201 in the spring is also likely to reach *Proficient* on the K-PREP test. The spring cut score is higher than the fall cut score because growth is expected between fall and spring as students receive more instruction during the school year.

Within this report, the cut scores for fall and winter are derived from the spring cuts and the typical growth scores from fall-to-spring or winter-to-spring. The typical growth scores are based on the default instructional weeks most commonly encountered for each term (Weeks 4, 20, and 32 for fall, winter, and spring, respectively). Since instructional weeks often vary by district, the cut scores in this report may differ slightly from the MAP Growth score reports that reflect instructional weeks set by partners. If the actual instructional weeks deviate from the default ones, a student's projected performance level could be different from the generic projection presented in this document. Partners are therefore encouraged to use the projected performance level in students' profile, classroom, and grade reports in the NWEA reporting system since they reflect the specific instructional weeks set by partners.

**Table 3.2. MAP Growth Cut Scores—Reading**

K-PREP Reading*

\*Cut scores for fall and winter are derived from the spring cuts and growth scores based on the typical instructional weeks. Bolded numbers indicate the cut scores considered to be at least proficient for accountability purposes.

### 3.4. Classification Accuracy

Table 3.4 presents the classification accuracy summary statistics, including the overall classification accuracy rate. These results indicate how well MAP Growth spring RIT scores predict proficiency on the K-PREP tests, providing insight into the predictive validity of MAP Growth tests. The overall classification accuracy rate ranges from 0.80 to 0.81 for Reading and 0.82 to 0.85 for Mathematics. These values suggest that the RIT cut scores are good at classifying students as *Proficient* on the K-PREP assessment.

Although the results show that MAP Growth scores can be used to accurately classify students as likely to be proficient on the K-PREP tests, there is a notable limitation to how these results should be used and interpreted. K-PREP tests and MAP Growth assessments are designed for different purposes and measure slightly different constructs even within the same content area. Therefore, scores on the two tests cannot be assumed to be interchangeable. MAP Growth may not be used as a substitute for the state tests and vice versa.

**Table 3.4. Classification Accuracy Results**

Grade	N	Cut Score		Class. Accuracy*	Rate*		Sensitivity	Specificity	AUC*
		MAP Growth	K-PREP		FP	FN			
<b>Reading</b>									
3	9,619	201	210	0.81	0.22	0.17	0.83	0.78	0.88

5	10,013	214	210	0.80	0.23	0.19	0.81	0.77	0.87
6	10,440	217	210	0.81	0.22	0.17	0.83	0.78	0.89
7	10,283	220	210	0.81	0.22	0.17	0.83	0.78	0.89
8	10,038	224	210	0.80	0.24	0.17	0.83	0.76	0.88
<b>Mathematics</b>									
3	9,635	205	210	0.82	0.18	0.18	0.82	0.82	0.90
4	10,164	214	210	0.83	0.16	0.18	0.82	0.84	0.91
5	10,011	222	210	0.83	0.15	0.18	0.82	0.85	0.91
6	10,449	225	210	0.84	0.15	0.18	0.82	0.85	0.92
7	10,312	231	210	0.85	0.14	0.15	0.85	0.86	0.93
8	10,004	236	210	0.84	0.15	0.18	0.82	0.85	0.91

\*Class. Accuracy = overall classification accuracy rate. FP = false positives. FN = false negatives. AUC = area under the ROC curve.

### 3.5. Proficiency Projection

Table 3.5 and Table 3.6 present the estimated probability of achieving the *Proficient* performance level on the K-PREP test based on RIT scores from fall, winter, or spring. For example, a Grade 3 student who obtained a MAP Growth Reading score of 201 in the fall has an 89% chance of reaching proficiency or higher on the K-PREP test. “Prob.” Indicates the probability of obtaining proficient status on the K-PREP test in the spring.

**Table 3.5. Proficiency Projection based on RIT Scores—Reading**
